Dermatofibrosarcoma protuberans (DFSP) is a rare form of soft tissue sarcoma that is located on the trunk in about half of the cases. The lesion is often a slow growing and painless. Symptoms can occur from mass effect from local invasion. The institution of wide local excision and margin control reduces the need for additional treatments. It can also cause pain and swelling and this results in the need for wide local excision and margin control. The lesion is often a slow growing and painless.
