## Statement of Purpose

The objective of this study was twofold:

1. Develop a triplanar classification system to characterize the 3D hallux valgus (HV) deformity
2. Perform an early evaluation of a novel procedure that allows for triplanar correction and immediate weight-bearing (WB) after Lapidus arthrodesis

## Literature Review

### Current Hallux Valgus Treatment Paradigm

- Current HV classifications primarily severity-based, relying on 2D transverse-plane measures in AP x-rays
  - Most HV procedures are transverse-plane osteotomies
    - Demonstrating 30-78% radiographic recurrence<sup>1,2</sup>
  - Recent CT studies indicate 87% bunions are 3-plane deformities, with metatarsal frontal-plane rotation<sup>3</sup>
  - Failure to correct metatarsal frontal-plane rotation associated with increased recurrence rates:
    - 10.0X if sesamoids not corrected<sup>4</sup>
    - 12.7X if rotation uncorrected (“lateral round sign”)<sup>5</sup>
- ➔ Need for a triplanar HV classification

### Triplanar 1<sup>st</sup> TMT Fusion & Immediate Weight-Bearing

- TMT is convenient site for 3-plane anatomic correction at apex of deformity (anatomic CORA)
- Traditional limitation is inability to WB early
  - Recent studies challenge WB standards following Lapidus, with limited WB at 2-3 wks<sup>6,7</sup>
- Recently developed multiplanar plating constructs rely on relative stability & secondary (“biologic”) healing<sup>8,9</sup>
  - ➔ New constructs may allow for immediate WB

## Triplanar Hallux Valgus Classification<sup>10</sup>

Class	Anatomic Findings	MTP Joint Status	Treatment Recommendation
1	<ul style="list-style-type: none"> <li>• Increased HVA and IMA</li> <li>• <b>No 1<sup>st</sup> metatarsal pronation</b> evident on AP and sesamoid axial radiograph</li> <li>• Sesamoids may be subluxed</li> </ul>	<ul style="list-style-type: none"> <li>• No clinical or radiographic evidence of DJD</li> </ul>	<ul style="list-style-type: none"> <li>• Transverse plane corrective procedure</li> <li>• +/- Distal soft tissue procedures</li> </ul>
2A	<ul style="list-style-type: none"> <li>• Increased HVA and IMA</li> <li>• <b>1<sup>st</sup> metatarsal pronation</b> evident on AP and sesamoid axial radiograph</li> <li>• <b>No sesamoid subluxation</b></li> </ul>	<ul style="list-style-type: none"> <li>• No clinical or radiographic evidence of DJD</li> </ul>	<ul style="list-style-type: none"> <li>• Triplane correction with 1<sup>st</sup> met. supination</li> </ul>
2B	<ul style="list-style-type: none"> <li>• Increased HVA and IMA</li> <li>• <b>1<sup>st</sup> metatarsal pronation</b> evident on AP and sesamoid axial radiograph</li> <li>• <b>With sesamoid subluxation</b></li> </ul>	<ul style="list-style-type: none"> <li>• No clinical or radiographic evidence of DJD</li> </ul>	<ul style="list-style-type: none"> <li>• Triplane correction with 1<sup>st</sup> met. supination</li> <li>• + Distal soft tissue procedures</li> </ul>
3	<ul style="list-style-type: none"> <li>• Increased HVA and IMA</li> <li>• <b>&gt;20 degrees metatarsus adductus (MTA)</b></li> </ul>	<ul style="list-style-type: none"> <li>• No clinical or radiographic evidence of DJD</li> </ul>	<ul style="list-style-type: none"> <li>• Met. 2 &amp; 3 transverse plane correction.</li> <li>• Followed by 1<sup>st</sup> met. correction (per class 1 &amp; 2 recommendations)</li> </ul>
4	<ul style="list-style-type: none"> <li>• Increased HVA and IMA</li> <li>• +/- 1<sup>st</sup> metatarsal pronation</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Clinical and/or radiographic evidence of DJD</b></li> </ul>	<ul style="list-style-type: none"> <li>• First MTP Arthrodesis.</li> <li>• Resectional/implant arthroplasty may be utilized</li> </ul>

## Methods

- Design: Retrospective, multi-center consecutive series
- Surgical Procedure: **Instrumented 3-plane, 1<sup>st</sup> TMT correction** with **2 mini-plate** multiplanar fixation (without interfragmentary compression)
- Exclusion: Class 3 & 4 HV patients
- Post-op Regimen: **Immediate WB** as tolerated in post-op boot
- HV Cohort: 49 patients, **4.3±1.0 mo follow up** (min 3 mo)
- Data Analysis: Radiographic measures (IMA, HVA, TSP, Lateral Round Sign) and reported complications

## Results

### Triplanar Classification (pre-op):

6% Class 1, 43% Class 2A, and 51% Class 2B HV patients (note: Class 3 & 4 excluded)

Fig. 1 Post-op 3-plane x-rays after triplanar correction.

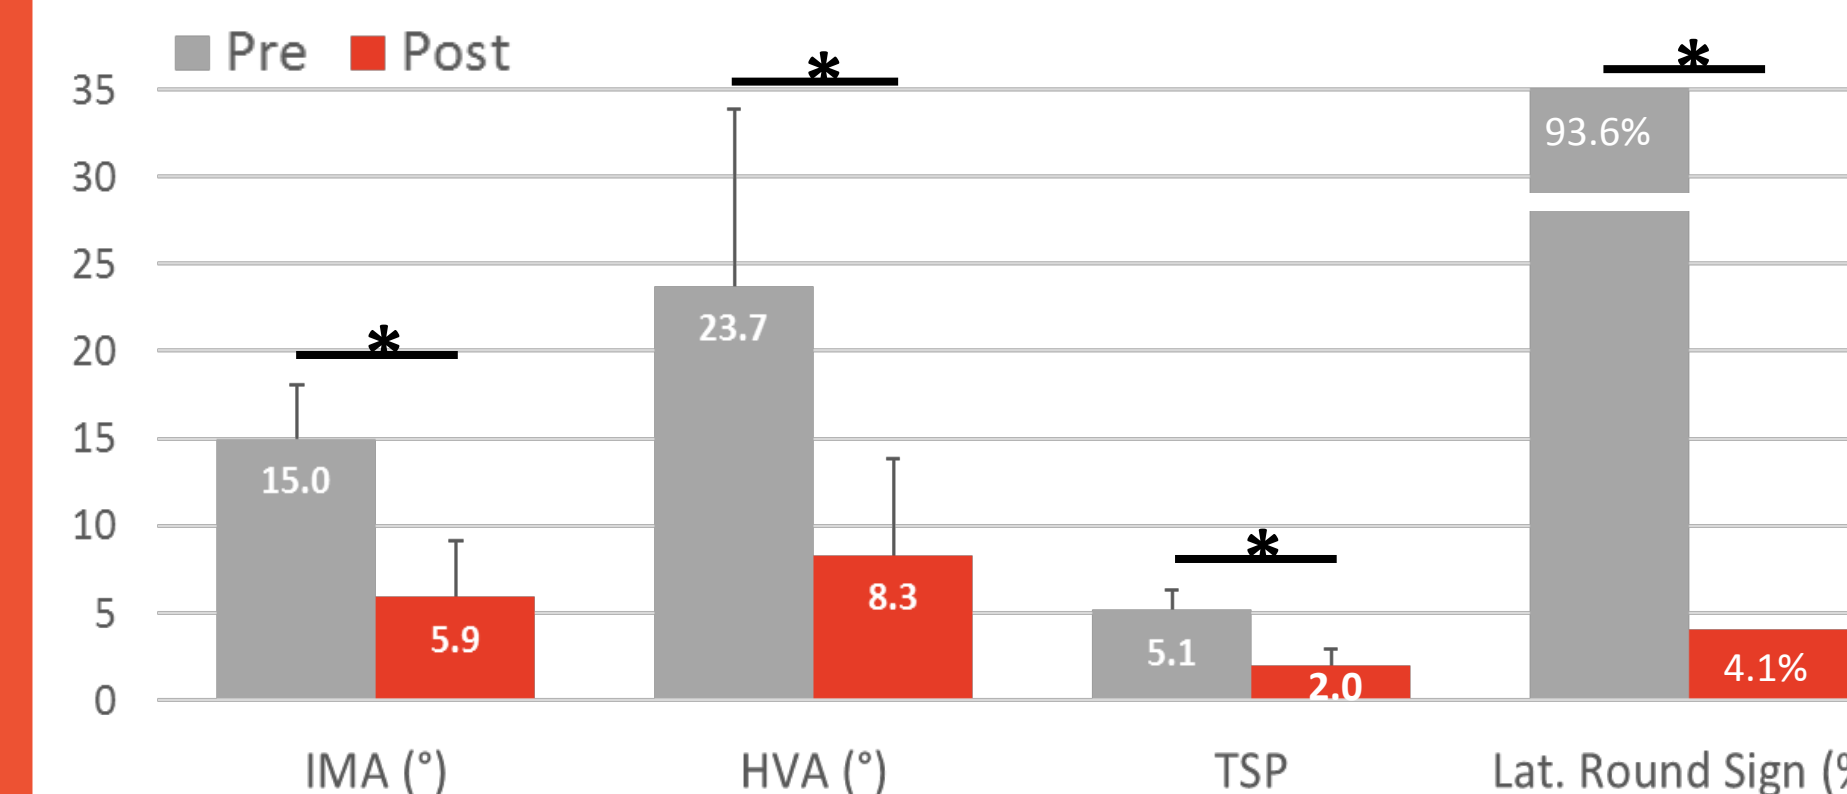

Fig 2. Anatomic 3-plane radiographic measures. \*p<0.001

Delayed wound healing/swelling	2 (4%)
Broken screw in fixation construct	1 (2%)
Hardware removal for soft-tissue irritation	1 (2%)
Undercorrection (IMA>10° or HVA>20°)	2 (4%)
Non-union	0 (0%)

Table 1. Complication rates.

## Discussion

This study presented a novel triplanar approach to the classification and treatment of the HV deformity

- Results demonstrate that triplanar HV deformity consistently corrected with triplanar 1<sup>st</sup> TMTJ fusion
    - Elimination of lateral round sign (met. frontal-plane rotation) in 95.9% patients
    - Three-plane correction maintained at 4 mo
- ➔ Triplanar classification provides framework for 3-plane assessment and treatment

Immediate WB is possible after 1<sup>st</sup> TMT fusion

- Minimal complications observed, no non-unions
  - Consistent with previous studies showing excellent results with early (2-4 wk) WB<sup>6,7</sup>
- 2 mini-plate 90-90 construct provides multiplanar, relative stability
  - Allows WB to stimulate biological healing process<sup>9</sup>
  - Prior biomechanical results demonstrate superior to anatomic plate & compression screw<sup>8</sup>
